Experience

Saucelabs

Gurgaon

Senior Software Engineer - Backtrace team

January 2026 - Present

- Designed and led the live AWS-to-GCP migration plan for 20+ microservices for Backtrace, a ~\$8M USD product, guiding a teammate through execution, using multi-pass **rsync** pipelines to migrate **5 TB** of on-disk files and AWS **DMS** to migrate **500 GB** of DB state with zero data loss, and writing automation scripts that kept average per-service downtime to 30 seconds mostly followed by DNS cutover.
- Owned the reconciliation system for the PlayStation connector end-to-end, redesigning error retrieval from Sony's Recap servers to cut dashboard error mismatch from **40% to ~1%**, eliminating a long-standing data-integrity gap flagged by stakeholders.

Zepto

Bangalore

Software Engineer II

September 2024 - October 2025

- Designed and shipped the impersonation feature for the Brand Portal, building a centralized configuration service and middleware layer so internal teams could resolve customer issues proactively, reducing SLA breach tickets by **10%**.
- Built a Price Elasticity analytics dashboard with multi-tile visualizations, integrating **StarRocks** and Databricks to serve sub-**200ms** queries over **100+ million** rows for brand-level pricing insights.
- Architected an end-to-end contract management platform for Zepto-vendor partnerships, including a high-performance margin-calculation API (**150 RPS**, **50ms** p99 latency) with precedence-based resolution across SKU, brand, city, and category.

BrowserStack

Remote

Senior Software Engineer

April 2022 - August 2024

- Led the transition from a monolithic to **microservice** architecture with zero downtime, cutting latency **50%** while handling **400K req/hr** across **20K** terminals.
- Designed centralized data **archival** infrastructure with built-in recovery, automating daily archival of **5GB** of production data and **Redis** subscription-change monitoring via scheduled jobs.
- Built the team's **Kubernetes** CI/CD infrastructure on **EKS** using **Ansible**, **FluxCD**, **Jenkins**, later introducing **ArgoCD** to enable reliable rollback across services.
- Migrated a **190GB PostgreSQL** database to **MySQL** in production using AWS DMS with just 1 minute of downtime, tuning DMS throughput to manage database load safely.

BrowserStack

Mumbai

Software Engineer

Aug 2020 - March 2022

- Cut mobile device session error rates from **40% to 3%** by diagnosing **ADB** failures and device instability, and optimizing open-source tooling including SiteSpeed and Lighthouse.
- Built an iOS workflow activating the Paint Timing API using the XCUItest framework, shipping a highly-requested customer feature that drove a **20% increase in Speedlab** sessions.
- Integrated the **LaunchDarkly** feature flag system with a fault-tolerant fallback mechanism, scaling to **7K req/sec** with zero single points of failure.

Relevant Skills

Tech Stack: GoLang, Typescript, Java, Nodejs, Ruby on Rails, JavaScript, SQL, Postgres, MongoDB, Ansible, Nginx, Kafka

Tools: Docker, Redis, Kubernetes, Jenkins, AWS (EC2, EKS, S3, Route53, AuroraDB, DMS)

Proficiency: REST APIs, Microservices, CI/CD pipelines, Database Management

Interests: Backend development, DevOps, Distributed Systems

Projects

Sharevo.app

[App Store](#) [Play Store](#)

- Building a consumer tech product that syncs liked content across multiple social media platforms into one searchable, shareable feed. Integrates with the external developer APIs of different social media platforms.
- App built with **React**, backend written in **NodeJs** and hosted on **GCP** Compute, with authentication and database managed by **SupaBase**. The **Gemini** model is used to classify content into multiple categories.

Education

Army Institute of Technology

Bachelor of Technology - GPA: 8.9

Pune

July 2016 - June 2020
